

Company-Wise DSA Topics & LeetCode Questions

The table below lists **key DSA topics** for each company and example LeetCode problem IDs (questions) frequently asked in their interviews. Topics are grouped by category (arrays, strings, etc.), with problem numbers linked to LeetCode (for clarity). Citations indicate sources for interview patterns and topic emphasis.

Company	Topics (Sample LeetCode IDs)
TCS	Arrays: [1] Two Sum, [26] Remove Duplicates in Sorted Array, [53] Maximum Subarray, [189] Rotate Array, [268] Missing Number
	Strings: [125] Valid Palindrome, [151] Reverse Words in a String, [709] To Lower Case, [557] Reverse Words in a String, [20] Valid Parentheses
	Linked List/Trees: [206] Reverse Linked List, [104] Maximum Depth of Binary Tree
	DP/Other: [70] Climbing Stairs ¹ ₂
Infosys	Arrays: [1], [26], [53], [560] Subarray Sum Equals K
	Strings: [125], [151], [387] First Unique Character in a String
	Linked Lists: [21] Merge Two Sorted Lists, [142] Linked List Cycle II
	Trees/Graph: [94] Binary Tree Inorder Traversal, [200] Number of Islands
	DP/Greedy: [1143] Longest Common Subsequence, [416] Partition Equal Subset Sum, [435] Non-overlapping Intervals ³ ₄
Wipro	Arrays: [41] First Missing Positive, [189], [560]
	Strings: [125], [242] Valid Anagram

Company	Topics (Sample LeetCode IDs)
Linked Lists: [206], [141] Linked List Cycle	
Trees: [104], [100] Same Tree	
Graph/DP: [200], [416], [435] 5 6	
Accenture	Arrays: [189], [283] Move Zeroes, [215] Kth Largest Element
Strings: [557], [242]	
Math: [7] Reverse Integer, [50] Pow(x,n)	
<i>(Focus is on core logic — DP/graphs seldom needed at initial level)</i> 7 8	
Amazon	Arrays/Greedy: [1], [15] 3Sum, [283], [189]
Strings/Hash: [3] Longest Substring w/o Repeating, [125]	
DP: [322] Coin Change, [343] Integer Break, [322] (again)	
Graph: [200], [127] Word Ladder	
Stack: [20] Valid Parentheses	
<i>(Practice ~100+ medium/hard problems in these topics for Amazon-level prep)</i> 9 10)	
Microsoft	Algorithms (core patterns): [651] 4 Keys Keyboard, [285] Inorder Successor in BST, [365] Water and Jug Problem
Design: [642] Design Autocomplete, [631] Design Excel Sum Formula, [348] Tic-Tac-Toe Game	
Strings: [125], [186] Reverse Words in a String II, [71] Simplify Path	
Trees/Lists: [333] Largest BST Subtree, [270] Closest BST Value, [23] Merge k Sorted Lists	
<i>(Microsoft often reuses the same algorithms in different scenarios)</i> 11 .)	
12	

Company	Topics (Sample LeetCode IDs)
Uber	Recursion: [22] Generate Parentheses
Sliding Window: [76] Minimum Window Substring	
Greedy: [121] Best Time to Buy/Sell Stock I	
Trees/Graph: [100] Same Tree, [505] The Maze II	
Regex/Parsing: [694] Number of Distinct Islands (used here as a parsing example) ¹³ ¹⁴	
Startups	General: Mix of product-level topics. Common problems include arrays and strings: [1], [189], [125], [344] (reverse string). Also classic DP/graph problems (see Amazon/MSU list) as startups often ask FAANG-style questions. <i>Tailor topics to each startup's domain and expected difficulty (often medium-hard).</i>

Note: The lists above are illustrative examples. Actual questions vary by interview, but the cited topics and problems have been repeatedly reported in recent interview experiences ⁴ ⁶ .

Differences: Service vs Product Companies

- **Service-based firms** (TCS, Infosys, Wipro, Accenture) focus on **basic problem-solving**. Interviews often have fewer rounds and emphasize ease-of-implementation for array/string questions ¹⁵ . Expect mostly easy-medium problems and core CS fundamentals.
- **Product-based firms** (Amazon, Microsoft, Uber, startups) demand **deep DSA mastery**. They conduct multiple coding rounds, including harder algorithmic and system-design questions ¹⁵ ⁹ . You must tackle medium-hard problems (especially on trees, graphs, DP) and explain your reasoning clearly.

Roadmap to FAANG-Level Preparation

1. **Build Fundamentals (Service-level):** Begin with basic topics: arrays, strings, simple recursion, and iteration. Solve dozens of easy questions to gain confidence (e.g. LeetCode Top Interview Questions ⁴). For example, practice 30–50 easy/medium problems on array manipulation, string reversal, searching, etc.
2. **Intermediate Practice:** Introduce linked lists, hashing, and moderate DP/greedy. Solve ~100 problems including those tagged for companies like Infosys/Wipro (medium level). Focus on mastering patterns (sliding window, binary search, basic DP) as they appear often ⁴ .
3. **Advanced Practice (FAANG-level):** Tackle hard problems in graphs, DP, backtracking, and system design. Aim for **100–150+** medium/hard problems as recommended for Amazon/Microsoft

candidates ⁹ . Repeatedly practice tough topics (e.g. graph traversals, LCS knapsack variants). At this stage, also study system-design basics for senior roles.

4. **Simulate Real Interviews:** Use timed mock tests and whiteboard coding sessions. In online assessments, **attempt all questions** (many company tests have no negative marking ¹⁶). Learn to parse inputs quickly (e.g. reading space-separated lines) ¹⁷ .
5. **Communication & Strategy:** During interviews, articulate your approach step-by-step. Start with a brute-force solution and then optimize (showing your thinking) ¹⁶ . Clarify requirements before coding. After solving, discuss complexity and potential edge cases.
6. **Practice Targets:** A useful guideline is **100 medium-hard problems** for top product roles ⁹ , and a smaller set for service roles. Balanced practice (mix of new problems and re-solving known ones) is key to recognizing patterns quickly.
7. **Behavioral Preparation:** For product companies, review company-specific values (e.g. Amazon's Leadership Principles). Be ready for behavioral questions in every interview stage.

By systematically progressing from basic to advanced topics and repeatedly practicing core problem patterns, you can transition from clearing service-company interviews to excelling in FAANG-level coding interviews. Key tips include **mastering input/output handling, time management** (solve easy problems first) ¹⁶ , and **explaining your code** clearly during interviews.

Sources: Collected from recent interview experiences and guides ^{1 3 5 7 9 11 13 6} , these topics and problem examples reflect the most frequently reported questions for each company's coding rounds.
